### • Clone with HTTPS

- To clone the repository and run locally, first the user must have a valid github account
- Log in to personal github account
- Naviagte to the repository home https://github.com/willissa2121/library\_checkout\_proj\_3
- Click the large green *Clone* button
- Select Clone with HTTPS
- Copy the url
- Open terminal on local machine
- navigate to the directory you want to clone the repo to
- type the following command into your terminal
- git clone ⟨copied url ⟩
- the repo will clone the directory
- To enter the directory, type the following command
- cd library\_checkout\_proj\_3

# 2 Running application

### • Run UI standalone

- To run the UI standalone, navigate to the UI directory
- $-\operatorname{cd} project-ui$
- Install dependencies and run start script
- npm install
- npm run start
- The UI should start in standalone mode as a dev server on localhost:8080

### • Run full application

#### - Pre-requisites

- \* Node installed (12x or later)
- \* NPM package library configured
- \* Maven installed
- \* Postgres DB server installd and running on port 5000

### • Run Locally

- To run the full application, naviagate to the root directory
- Intall all dependencies of all sub projects
- Maven update project
- Maven build project
- To run the application once all depdencies are installed, run the LibraryMain Class
- The application will server to localhost:8080
- The UI will no longer be reactive to change, as it is built and not server as a dev server
